```

We observe non-permanent Security Council tenures with the first year being 1946 to 2014, (the second year of the most recent tenure is 2015). There are a total of 315 country tenures.

```
OneYearTenures=SCTenures[is.na(SCTenures$SCYearTwo),]
NumOneYearTenures=dim(OneYearTenures)[1]
OneYearTenures=OneYearTenures[order(OneYearTenures$SCYearOne),c("StandardName", "SCYearOne")]
colnames(OneYearTenures)=c("Country", "SC One Year Tenure")
rownames(OneYearTenures)=1:dim(OneYearTenures)[1]
```

Normally countries are on the Security Council for two years at a time, however there are 15 cases where the country is on the UNSC for just one year. In the permutations, we do not treat these tenures differently. These one-year tenures exist in the permutations at the historic moment where they existed, and any country that is eligible for assignment in a given year may be assigned to the one-year tenures.

```
# For the time span 1946-1965

Turkey

Turkey is a special case because it was a part of two regions in the period 1946-1965. It serves twice on the UNSC as part of the Eastern European and Asia Region, but once, starting in 1951, on the UNSC as a Middle Eastern representative.

```

Preliminaries for the Permutations

The permutations are based on the idea of assigning the most constrained countries first.

We calculate a variable for the number of times we observe a country on the UNSC - (number of tenures) - by country and by region (which changes at 1966). This variable is the starting point for keeping track of reassignment. As reassignments are made, we subtract off tenures for individual countries, the remaining tenures, still unassigned will enter into the probability of being assigned or not.

```
SCTenures$Observation=1
TimesOnSC=with(SCTenures, aggregate(Observation, by=list(StandardName), FUN=sum))
names(TimesOnSC)=c("StandardName", "NumTenures")
head(TimesOnSC)
```

```
##      StandardName NumTenures
## 1      Algeria          3
```

```
## 2      Angola          1
## 3      Argentina       9
## 4      Australia       5
## 5      Austria         3
## 6      Azerbaijan      1
```

```
SCTenures=merge(SCTenures, TimesOnSC, by="StandardName")
dim(SCTenures)
```

```
## [1] 315  11
```

The “Long UNmember Data” allows us to understand the temporal range of possibilities. We will not allow a country’s Security Council tenure reassignment to be to a year in which the country is not yet a U.N. member.

```
load("03_UNMemLong.RData")
UNMember=UNMemLong
```

We aggregate on both region and country to get the “RegionCountryNumTenures“. We’ll sort on this. The greater the number of tenures in a region, the more problematic a country might be in terms of reassignment. We don’t want such countries to be crowded out of allowed reassignments - i.e. have other reassignments force them into implausible timings. \

```
options(width=75)
CountryRegionsTenure=with(SCTenures, aggregate(StandardName,
                                              by=list(StandardName, Region),
                                              FUN="length"))
head(CountryRegionsTenure)
```

```
##      Group.1      Group.2 x
## 1  Australia Commonwealth Seat 2
## 2      Canada Commonwealth Seat 2

## 6 New Zealand Commonwealth Seat                 1
```

The number of years on the U.N. also contributes to the level of constraint for a reassignment, this is because the fewer years a country is on the U.N., the fewer years there are available for reassignment.

```
